

ACNE

Protocols for transdermal delivery

1. Make an abrasión or mechanical peel of the area to be treated in order to remove keratinocytes and increase skin permeability
2. Cleanse with non-alcoholic product
3. Apply mixture by dropping little quantity out of the syringe only over a small area until complete absorption, move on with the next area. Respect the time indicated by your device manufacturer. If your device needs a conductor gel, mix the solution to it or apply first the gel over the area and drop the mixture.
4. Finishing the treatment remove product remaining.
5. Apply post cream. Recommend maintenance with MesoAge and MesoVita. Inform patient about Ageing related issues as nutrition, smoking, sun exposure and balanced life style.
6. Register in the patient chart the mixture used, the area treated and other observations.

Create most appropriate mixture individually for your client's skin problem.

Mixtures quantities can be changed according to the treated area and the system used.
